Parker Autoclave Engineers first introduced the Dispersimax™ Turbine to the research industry in 1955, followed in 1958 by the MagneDrive® for contamination-free, packless agitation. Since then, several other impeller designs have been developed to satisfy specific industry needs.

Custom engineering of impeller design can be performed based on developed horsepower, viscosity, critical speed and other key factors associated with specific processes.

At a Glance:
- Several Standard Designs
- Materials to Match the Vessel
- Suitable for Gas, Liquid, and Supported Solids
- Wide Range of Viscosity and Speed
- Custom Engineered Designs Available

Dispersimax™ Turbine

Parker Autoclave Engineers’ patented Dispersimax™ Turbine type impeller is well suited for gas/liquid reactions. It provides high speed radial flow stirring, while drawing head space gas down a hollow shaft and dispersing the gas through the impeller ports, for effective entrainment of the gas into the liquid. This is generally for low viscosity applications.*

Standard sizes available: 7/8”, 1-1/4”, 2” and 4” diameter.

*Vessel baffling is required for optimum performance.
Anchor Impeller

Best suited for high viscosity fluids (5,000-50,000 cp). This impeller provides radial flow and improved heat transfer at relatively low speeds. It generally provides minimal radial clearance between it and the vessel wall. Anchor impellers can be provided with wipers and/or cross arm support.

Formerly known as the “Rushton Turbine”, this impeller, like the “AE Dispersimax™ Turbine”, is suited for gas/liquid applications requiring fairly high shear at high speeds.* The impeller also promotes radial fluid flow. *Vessel baffling may be required for optimum performance.

Pitched Blade Turbine

Sometimes termed an “axial flow impeller”, the Pitched Blade Turbine is especially suited for high speed liquid/solid applications where tank baffles may be impractical. Direction of fluid flow can be up or down depending on the pitch. The pitch angle can vary between 0° and 90° from the vertical.

Curved Blade Turbine

Often referred to as a “backswept turbine”, this impeller can be used in very viscous mixtures where power consumption can be of concern or in liquid/friable solid applications.* It provides reduced shear and a radial flow pattern.*Vessel baffling may be required for optimum performance.
Helical impellers are used primarily in applications involving very viscous materials. They operate with minimal clearance at the vessel wall and provide axial flow at low speed. Their construction can be single or double outer flight with or without an inner flight. The outer flight provides upward pumping action while the inner flight pumps in the downward direction. (The inner flight does not add to impeller performance in the case of Newtonian fluids.) These impellers, like the Anchor, provide improved heat transfer in a viscous fluid system.
The Elongated Paddle impeller provides a combination of axial upward and radial fluid flow. It, like the Anchor and Helical Impellers, operates in close proximity to the vessel wall.

The Marine Propeller is an axial flow impeller generally pitched for downward pumping action, however, upward pumping is also available. This impeller provides a high, uniform discharge and therefore is best suited for low viscosity liquid blending applications. *Vessel baffling may be required for optimum performance.*

WARNING
FAILURE, IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS AND/OR SYSTEMS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product and/or system options for further investigation by users having technical expertise. It is important that you analyze all aspects of your application and review the information concerning the product or system in the current product catalog. Due to the variety of operating conditions and applications for these products or systems, the user, through his own analysis and testing, is solely responsible for making the final selection of the products and systems and assuring that all performance, safety and warning requirements of the application are met. The products described herein, including without limitation, product features, specifications, designs, availability and pricing, are subject to change by Parker Hannifin Corporation and its subsidiaries at any time without notice.

Offer of Sale
The items described in this document are available for sale by Parker Hannifin Corporation, its subsidiaries or its authorized distributors. Any sale contract entered by Parker will be governed by the provisions stated in Parker’s standard terms and conditions of sale (copy available upon request).

Caution! Do not mix or interchange component parts or tubing with those of other manufacturers. Doing so is unsafe and will void warranty.

Caution! Parker Autoclave Engineers Valves, Fittings, Systems, and Tools are not designed to interface with common commercial instrument tubing and are designed to only connect with tubing manufactured to Parker Autoclave Engineers AES specifications. Failure to do so is unsafe and will void warranty.
